                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-08-929-967-1/C

Sequence 1, Application US/08929967

Patent No. 5891637

GENERAL INFORMATION:

APPLICANT: Ruppert, Siegfried J.W.

TITLE OF INVENTION: Construction of Full-Length cDNA Libraries

TUTLE OF INVENTION: Construction of Full-Length cDNA Libraries

NUMBER OF SEQUENCES: 16

CORRESPONDENCE ADDRESS:

ADDRESSEE: Genentech, Inc.

STREET: 1 DNA Way

CITY: South San Francisco

STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5443;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

E. coli Y1090 and phage DNA was purified from a liquid lysate. The cDNA inserts were gel purified after EcoRI digestion and ligated into pBluescript SK+. Aliquots of the ligation were used to transform E. coli DH5alpha which were plated onto medium with X-gal for selection of recombinants."

                                                                                   /note="Marine viruses were isolated from 200 liters of surface seawater using a combination of differential filtration and density-dependent gradient centrifugation. Linker-amplified shotgun libraries were constructed by randomly shearing the total marine viral community DNA, end-repairing, ligating dsDNA linkers to the ends, and amplifying the fragments using Vent DNA polymerase. The resulting fragments were ligated into the pSMART vector and electroporated into MC12 cells (Lucigen; Middleton, W1)"

Benomic analysis of uncultured marine viral communities
Proc. Natl. Acad. Sci. U.S.A. 99 (22), 14250-14255 (2002)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Journal Marine viruses were isolated from 200 liters of surface Seawater using a combination of differential filtration and density-dependent gradient centrifugation. Linker-amplified shotgun libraries were constructed by randomly shearing the total marine viral community DNA, amplifying the fragments using Vent DNA polymerase. The resulting fragments using Vent DNA polymerase. The resulting fragments were ligated into the pSWART vector and electroporated into MC12 cells (Lucigen; Middleton,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /organism="uncultured marine virus"
